

KDAB / MECAPS

MODERN EMBEDDED C++ APPLICATION STARTER

```
$ ./mecaps_demo_ui
```

```
[core] KDUtils cross-platform application core
[ui]   Slint user interface
[build] CMake and C++20
[loop] KDFoundation event integration
[api]  KDBindings properties, signals and slots
```

A practical starting point for embedded and desktop software.
Qt-free application structure. Clear integration boundaries.
Built and maintained by KDAB.

MECAPS / ABOUT

```
$ cat README.md
```

PURPOSE

MECAPS is a starter template for modern C++ applications. It provides a small, practical foundation for embedded and desktop projects without imposing a second UI framework.

FOUNDATION

- KDUtills supplies the cross-platform application core.
- Slint supplies the declarative user interface.
- CMake organizes configuration and builds.
- C++20 is the project language baseline.

INTEGRATION

Components connect through the KDFoundation event loop. KDBindings provides properties, signals and slots for clean communication between application services and UI.

PROJECT

Maintained by KDAB and available under your choice of the MIT or Apache-2.0 license.
